Hoshin Kanri for the Lean Enterprise, 1st Edition

Companion CD Volume 2

Volume 1 contains PDFs of templates and instructions for Chapter 8 of *Hoshin Kanri for the Lean Enterprise.* Templates, tools and instructions for Chapters 1-7 will be found in Volume 1. All of these documents originally shipped with the 1st edition on a CD-ROM.

The table of contents on page 1 contains links to each of the documents.

CONTENTS

CD Form 8-1. Transformation Ruler

 The 5 rules of the DNA of lean enterprise mapped against the Deming Cycle of plan do check and act (PDCA). Many large organizations know how to plan and do, but they fail to check and act. This means that they have no effective organizational memory and thus constantly solve the same problems again and again. The point to the transformation ruler is to check progress and act on it, making it a permanent part of organizational culture.

CD Form 8-2. Diagnostic Scorecard

• A simple scorecard to track a company's progress in learning in eleven subject matter areas affected by lean enterprise organization and methodology.

CD Form 8-3. Diagnostic Form

• A useful form to support scoring a particular subject matter area during a site visit.

NOTE: The following progress tables contain subject matter information for eleven different areas that must be mastered to effect the transformation from mass production to lean enterprise. The subject matter for each category has been organized into relevant subcategories and mapped against the Deming Cycle.

- CD Form 8-4. Management Systems Progress Table
- CD Form 8-5. Finance & Accounting Systems Progress Table
- CD Form 8-6. Human Resource Systems Progress Table
- CD Form 8-7. Supply Chain Management Systems Progress Table
- CD Form 8-8. Information Systems Progress Table
- CD Form 8-9. Quality Systems Progress Table
- CD Form 8-10. Marketing & Sales Systems Progress Table
- CD Form 8-11. Engineering Systems Progress Table
- CD Form 8-12. Manufacturing Operations Progress Table
- CD Form 8-13. Maintenance Systems Progress Table
- CD Form 8-14. Materials Management Systems Progress Table

	mass	Finance	& Accounting	Systems	lean
	scan	plan	do	check	act
Profit Management	No profit planning. Com- pany uses externally fo- cused, GAAP-based ac- counting systems to maxi- mize paper profits for Wall Street and minimize them for the IRS. No evidence of any per-	Focus on results does not ensure results. Share price eroding despite ef- forts to please Wall Street. Company begins to question its under- standing of "profit."	Company adopts EBITDA or other valuation-focused measure of profit. Exter- nal and internal account- ing systems differentiated, but externally-focused system still dominates. Measurables based upon	Internal and external ac- counting systems strictly differentiated, with inter- nal systems focused on long-term cash flow im- provement.	Profit planning has re- placed traditional budget- ing and is fully integrated with hoshin kanri. The company routinely meets its profit targets. The company is focused
Performance Management	formance measurables. Re- sults based measures used w/out awareness that they hinder improvement.	based on traditional ac- counting system but not reacted to. Top manage- ment makes balanced scorecard of financial & process improvement measures, but doesn't deploy it beyond the ex- ecutive suite.	traditional accounting, but now used to target im- provements. Beginning to switch from financial to nonfinancial measurables, such as OEE, total people cost, inventory turns, etc. New scorecard deployed to managers & supervi- sors; but old financial measures still used.	card" or X-matrix to put tactics in place to improve nonfinancial measures, the true causes of financial success. New process im- provement measures im- proved, results based measures support cause/effect analysis.	on process improvements that build competitive ca- pability. Performance measures are stratifiable to support front-line deci- sion-makers as well as top-level strategists. Modeling of financial implications of various policy alternatives during strategy re-vision.
Cost Accounting	No evidence of standard costing or budgeting proc- esses. No evidence of any process improvements.	Company run using tra- ditional accounting tools such as standard costing & departmental budgets. Improvements based 100% on budget variance reporting	Company has a good idea of what product costs & runs departments based on variance from standard cost. Pareto analysis used to identify major im- provement projects.	Overhead allocation based on activities caused by product flow. Company beginning to use kaizen or kaizen.	Kaizen costing & kaizen staples of financial sys- tem. Measurement sys- tem includes OEE, total people cost per unit, in- ventory turns, & cus- tomer satisfaction. Kai- zen methods totally inte- grated into fiber of com- pany
Target Costing	Direct costs targets primar- ily set for materials. Model: Cost + Profit = Price. Company designs product, determines its costs, & adds in a profit to determine selling price. Cost reductions focused on material price.	Semi-structured process to identify direct product costs for "go/no go" product development de- cisions. Model: Cost + Profit = Price. Company designs product, deter- mines its costs, & adds in a profit to determine selling price. Some cost reduction efforts during product development phase. "Targets" are set, but not met.	Structured decision proc- ess to evaluate & improve product development. Model: Price - Profit = Target Cost. Company identifies market price of a product, subtracts its re- quired profit, & deter- mines a true target cost. Target costs normally met, products.	Target costing process for product development, product costs evaluated & undergo value engineering to obtain lowest costs. Target Cost model uses marginal pricing strategy in estimating market price. Target costs routinely met on all major new product introductions.	Addition of vendors & customers into target costing process. Target cost model constantly challenges organization understanding customers' perception of value. Tar- get costs regularly beaten. Savings realized. Com- panywide plan to attack all part numbers & beat all costs.
Strategic cost Management	No plan. Profits eroding. Designs of critical compo- nents dictated to suppliers. Heavy pricing pressures, but unable to reduce costs.	Contentious improve- ment attempts, price re- duction pressure.	Informal lean liaison w/ customers & suppliers, moderate savings results. Seeking mutual benefit w/in framework of target costing.	Close working relationship involving many cross- functional teams, sharing information & technology based on long-term objec- tives. Kaizen framework well established both at company & key suppliers.	Formal lean programs w/ customers & suppliers, sharing of savings & knowledge. Mature lean product development programs w/ customers & suppliers
Life cycle Costing	Capital equipment expen- ditures are based solely upon equipment utiliza- tion. Maintenance budgets are prime targets for cost cutting. Plant and equip- ment in obvious disrepair.	Manufacturing has begun to implement OEE. Good information is created about equipment condi- tions, but finance ques- tions need to restore equipment.	Finance now sees the value of OEE as a true measure of capacity and supports restoration decisions in most cases. Life cycle costing applied to capital equipment acquisition for the first time, with focus on maintainability and quick changeover capability.	Life cycle costing now ap- plied to most equipment acquisition decisions, with input from maintenance and production. No new equipment decisions are sanctioned until produc- tion can prove exiting equipment achieves > 85% OEE.	Life cycle costing applied to all equipment acquisi- tion decisions, based upon major input from production and mainte- nance.

	scan	plan	do	check	act
People Are the key	Management & labor don't communicate, except over bargaining table or at an- nual address	Planning begins to radi- cally decentralize deci- sions-making by empow- ering workforce. Initial discussions between la- bor & management lead- ership establish business direction & PDCA sys- tem implementation.	Further discussions ad- dress competitiveness issues & establish timing, responsibilities & expec- tations. Joint improvement teams have been estab- lished to address key areas such as quality, training, safety, & to establish ap- propriate directions.	Labor & management fo- cus on PDCA system im- plementation. Key union leaders on board. Joint la- bor/management leader- ship can separate contrac- tual from customer and in- dustry sues.	Competitiveness jointly addressed to assure supe- rior customer satisfaction & provide long-term job security. Improvement teams utilize most effec- tive combination of hourly & management personnel to improve cus- tomer satisfaction.
Team Building	No structured work groups. Wasteful motion & too many associates. Fixed job assignments & poor bal- ance.	Planning begins to in- volve entire workforce on teams Work groups forming. Roles & respon- sibilities defined.	Associates rotate jobs by shift, not by task. Team members set own goals, but not fully aligned w/ hoshin.	Most associates on formal teams. Supervisors trained in new coaching role. Halfway toward achieving smooth multi-process op- erations. Better alignment w/ hoshin.	Teams & work groups all trained. Cross-training charts posted to track versatility. Job assign- ments flexible. Com- pany hoshin determines improvement initiatives.
Leadership Development	Only managers & new as- sociates trained. No sys- tematic training in PCDA methods.	Industry & benchmarks assessed & planning be- gins to develop all top, middle, & front-line managers in principles, concepts, & practices of lean enterprise	Company wide training in PDCA methods begins & leaders participate in teaching. One kaizen event per site in last 12 months. But skill transfer still sporadic & retention of methods poor.	Development programs support education & train- ing in basic skills & PDCA methods. 6 kaizen events per site in past 12 months Training available to sup- port company's hoshin.	Continuous training & re- training of office staff & machine associates in best practices systema- tized. 24 kaizen events per site in past 12 months.
Cross-training & Job rotation	Each associate only knows one job. No training or in- structions. No formal rota- tion.	Each associate knows more than one job & has some training. Changes job monthly.	Each associate knows several processes & has some training. Rotation weekly or sooner.	Multi-skilled associate w/frequent cross training. Daily rotation.	Operations utilizing stan- dardized work. Staffing levels vary by demand. associates rotated w/in shift.
Compensa- tion & Recog- nition	Compensation based on hours & seniority, recogni- tion arbitrary or based on seniority.	Industry & benchmarks assessed & planning be- gins to adapt best com- pensation practices to needs of business.	Performance-based pay initiated for managers, suggestion schemes initi- ated for hourly associates	Limited gain sharing, Recognition system based on monetary & nonmone- tary motivators.	Variable pay based on gain sharing. Compensa- tion & recognition clearly linked to company policy & PDCA measurables
Safety	Health & safety not a con- cern. Improvements reac- tions to government inter- vention. Numerous acci- dents each year, some seri- ous.	Safety measures devel- oped. Industry & benchmarks assessed, pi- lot projects completed, & planning begins to im- plement best safety prac- tices.	Associates systematically trained to discover & eliminate unsafe opera- tions. Occasional lost-time accidents, some serious.	Health & safety standard & procedures documented & clearly posted. Meas- ures reflect improvement. No major lost-time acci- dents	Regular, standardized safety audits by teams & management reinforce safety standards. Factory almost accident free. Safety and ergonomics primary consideration in 3P (preproduction pio- neering).

	1	2	3	4	5	
	mass	Supply Cha	ain Manageme	ent Systems	lean	
	scan	plan	do	check	act	
Supplier Quality	Too many supplier quality issues. Supplier PPMs not measured. No feedback to supplier. Arms length rela- tionships. All contact clerical in nature or reac- tion to problems. No cost reduction process.	Limited feedback to sup- pliers, all reactive. Sup- pliers' problems not found until they reach manufacturing. 100% In- coming inspection re- quired.	Incoming inspection based on high PPMs or batch defect. Supplier in- spects own material. Established supplier de- fect allowances. Charge- backs for defective mate- rial.	Audit of incoming inspec- tion. Minimal defects guaranteed by supplier & top suppliers certified w/ no incoming inspection. Formal cost reduction ac- tivities in place.	No incoming inspection. Supplier involved in product development & problem resolution. Lean events held jointly w/ supplier.	
Supply base Selection & Supplier Measurables	Purchasing & Engineering each try to impose own fa- vorite suppliers. No sup- plier performance rating or scorecard used to monitor Technology, Quality, Cost, Delivery (TQCDs).	Purchasing & Engineer- ing select suppliers to- gether w/ some criteria to assist in decision mak- ing. Some site-based cri- teria used to score sup- plier TQCDs.	Project team makes final selection w/ some feed- back. Purchasing covers production & non- production purchases, selects suppliers, defines needs, draws up contract or purchase order & be- gins to monitor supplier performance.	Selection based on a stan- dard measurables used to monitor supplier TQCDs. Philosophy of a "win- win". Formal feedback sessions improve TQCDs. Suppliers, measured against annual goals w/ at- tention on productivity improvements.	Supplier base evaluated annually & action plans implemented for "kai- zen". Suppliers receive regular performance up- dates / reports. Suppliers & customer work closely together for shared cost reductions.	
Purchasing	Purchasing has no strategic direction & reacts to re- quests of other functions. Time spent on quick fixes. Little cross-functional communication. Arms- length dealings w/ suppli- ers norm. Buying crite- rion lowest price w/ sup- plier's role to provide goods or services that you can't make	Use competitive negotia- tion to challenge suppli- ers for piece price reduc- tions.	Systematic training of purchasing in latest tech- niques & practices begins. Coordination links estab- lished w/ technical disci- plines. Order processing & service characterize the process. Buying criterion lowest cost w/ supplier's role to provide goods or services in a cost-effective manner.	Purchasing strategies strengthen competitive po- sition. Buyers now on sales proposal teams. Sup- pliers & associates seen as resources. Markets, prod- ucts & suppliers continu- ously monitored & ana- lyzed. Buying criterion to maximize mutual benefit w/ goods supplied accord- ing to customer require- ments.	Purchasing fully inte- grated into firm's com- petitive strategy. Perma- nent lines of communica- tion established w/ or functions. Performance measured in terms of firm's success. Buying criterion to maximize to- tal supply network benefit w/ goods provided. Focus on value improvement & cost reductions.	
Supplier Reduction and Certification	Quality certified suppliers < 5%. Too many suppliers who ship poor quality, chosen based upon lowest bid & immediate need. Many suppliers for single products. Change suppliers often. Contracts awarded strictly on piece price.	Several suppliers for each product.	Supplier reduction and development begin w/ fo- cus on budget, manage- ment of finished goods & customer service. Quality certified suppliers < 50%. Suppliers drop in for goodwill visits & ask for quality assistance. A few suppliers used to keep competition & recovery.	Certified suppliers > 50% but < 90%. Company evaluates suppliers, carri- ers, & routes. Certification reduces number of suppli- ers. Most products have one or two suppliers. Self- certification promoted.	Supplier certification re- quired. Certification re- quired. Certificat suppliers > 90%. One supplier w/ long-term contract. Sup- pliers considered an ex- tension of manufacturing process. Support provided to bring partners to world-class status. Daily deliveries.	
Supplier Development	Doing nothing to improve supplier competitiveness. Demanding that suppliers have 3 rd -party accreditation such as ISO or QS 9000, forcing suppliers to have internal systems.	Willing to help suppliers solve problems on an ad hoc bas. Response ranges from quick fixes to in- depth solutions.	Taking a systematic ap- proach to helping suppli- ers improve. Training & certifying first-tier suppli- ers' internal lean champi- ons w/ qualified sensei. A few JIT deliveries piloted. Suppliers sit in on lean training.	Systematic approach ex- tends to suppliers in sec- ond tier.	Systematic approach to develop extends to key suppliers in second & third tier. Working w/ di- rect & second- & third- tier suppliers & custom- ers. Flow techniques pro- vide platform for com- petitive position.	
Enterprise- level Schedul- ing	Focus on short-term distri- bution efficiency, w/ reac- tive management & preoc- cupation w/ cost. No Mas- ter Production Scheduling (MPS) w/ constraint based planning.	Master Production Scheduling (MPS) proc- ess in place. Sporadic or some use of lean or other improvement tools.	Cross-functional MPS process achieves smooth- ing & level loading & fin- ished good's management. Enterprise Value Stream Map drives lean develop- ment activity.	Management of sourcing & production planning key to competitive strategy. MPS achieving stable pro- duction plans. Product- level value stream maps across entire business.	MPS integrated w/ a sen- ior management review process. Product level roadmaps established to achieve future state maps.	
Supplier of Choice	You do not measure your effectiveness as a supplier to your customers.	Your overall supplier ef- fectiveness (OSE) low. OSE = external quality x customer cost x delivery performance.	Immediate steps ensure perfect quality. Value stream maps show oppor- tunities for quality, cost & delivery improvements	OSE strong compared to your competitors, & stead- ily improving.	Delivery on demand w/ lean thinking & continu- ous replenishment. OSE > 98%.	

		2	3	4	5
	mass	Info	ormation Syste	ems	lean
	scan	plan	do	check	act
Workplace Organization	Hard for visitors to tell what goes where & when. Associates may or may not know either.	Unneeded items and in- formation have been re- moved from the work- place or placed at a dis- tance related to fre- quency of use. Factory uses outlining & location indicators for visual con- trol,	The workplace is neatly organized. All items have a specific address and re- turn address.	Clean, neatly organized w/ mess-prevention measures in force/	Lean culture is fully es- tablished. Associates would not return to old way of doing things if given the option.
Visual Control Systems	The workplace is full of ambiguous messages. There is no way to tell what internal or external customers want or how to satisfy them. Errors & ab- normalities often occur & only create confusion,	Errors & abnormalities often occur & usually resolved in some way.	Supervisors & team lead- ers can tell when defects, errors & abnormalities oc- cur.	Knowledge of customer requirements and how to fulfill them is encoded into the workplace.	Zero ambiguity about in- ternal and external cus- tomer requirements. Im- mediate action taken to resolve errors & abnor- malities
Suggestion System	No suggestion program of any kind, because there is no perceived value to company.	Still no formal sugges- tion program. There are some contributions, but no systematic implemen- tation.	Companywide suggestion program averages less than 5 suggestions per person per year.	Companywide suggestion program averages 6-19 suggestions per person per year.	Companywide suggestion program averages > 20 suggestions per person per year.
Computer Architecture and Data Processing	Limited access to comput- ers, use limited to administrative personnel. Batch updating overnight. Significant lags in data input.	Limited use in admin. only, & by individual shop on an "as need" ba- sis. Batch postings at end of shift.	Two or more separate computer systems, still uses mostly paper. Fre- quent posting of smaller batches.	One computer system, links customers, vendors & production but w/ some paper. Data captured at time of physical process- ing.	Paperless factory, one computer system, elec- tronic links to customers, suppliers. Real time on- line data processing.
Accounting/ MRP Systems	Outdated or legacy sys- tems. Inflexible monolithic systems or disparate sub- systems. "Canned" or pre- formatted reports or report- ing on offline systems, spreadsheets & databases.	W/out dated or legacy systems, but enhanced by customized applications. Pre-defined customized reports.	Customized applications to support manufacturing & value added activities. Reporting supplemented by simple reporting mod- ule w/ minimal lead-time to prep new reports.	Modular applications w/ transparent integration. Flexible reporting mod- ules. Customization on fly.	Modular, flexible systems based on commonized platform. Web-based in- terface w/ customers & suppliers. Addition of "drill down" reporting traceable to source docu- ments & data.
Bill of Materials Accuracy	Several different bills of materials (BOMs) and/or BOMs in excess of 4 lev- els, many maintained on private spreadsheets. Qual- ity has to physically meas- ure parts to know what they are.	Multi-level Uncontrolled & inaccurate. Interven- tion required to make correct product.	BOM accurate, & includes all material required. Up- dated & controlled on regular bas. BOM used to backflush inventory.	Simplified , single-level BOM Use of phantom lev- els on BOM to facilitate pull systems.	One common single level BOM. Updating tied to engineering change proc- ess & timely. BOM sim- plified to only carry un- common components.
Scheduling/ MRP	Push-based, build-to- inventory production plan- ning. Little or no forecast- ing. Large expediting staff, premium freight & produc- tion disruptions. Little or no inbound/outbound tracking.	Some products based on build-to-order. Some products on pull in final process. Heavily depend- ent on forecasting. Few production disruptions, some expediting staff, industry average pre- mium freight. Tracking of inbound/outbound lim- ited to windows of 2 days or more.	Build-to-order production planning. Some build to inventory products. No expediting staff. Some premium freight & expe- diting performed w/in job functions. Key products tracked w/ automatic shipping notifications or some type of on-time de- livery measurement.	Mostly build-to-order products. Many products on pull-based production systems. Minimal pre- mium freight & expedit- ing. Most inbound & out- bound tracked w/ manual on-time delivery methods.	Many products based on pull systems. Virtually no finished goods inventory. Rarely any premium freight or production disruption. Web-based shipping notices. External pull systems in effect.
MRP System	MRP system inaccurate, not used on floor. Exten- sive use of off-line, manual systems. Significant non- value added work for ma- terial transfers.	Use MRP for short term scheduling. Significant amounts of adjustments & expediting due to inac- curacies.	MRP used sparingly. Near-term scheduling & planning. Pull systems be- ing implemented for in- ternal moves.	MRP used for inventory control, w/ receiving & back flushing only trans- actions.	MRP for long-term plan- ning & external commu- nication. Pull systems in- ternally & externally for scheduling & authoriza- tion to ship/move.

	mass	C	Quality System	າຣ	lean
	scan	plan	do	check	act
Quality Organization	Large centralized quality control function. Inspec- tion & quality decisions performed by QC. QC per- sonnel check finished goods. Associates have no quality responsibility	Quality organization making decisions & process most product knowledge. Associates perform some quality in- spection.	Quality organization per- forms roving inspection audits. Work w/ finished goods. Personnel to re- solve quality sues. Asso- ciates perform go / no go tests	Inspection done as part of finished goods. Job. Qual- ity organization training & auditing process. Associ- ates perform Statistical Quality Control (SQC).	Quality Assurance orga- nization focused on train- ing, systems auditing, problem solving, & im- provement processes. As- sociates 100% responsi- ble for quality of the process.
Problem Solving Methodology	A few people familiar w/ PDCA tools. No poka yoke. Reliance on inspec- tion or customer to find defects. Processes not de- signed defect-free.	Defects & errors identi- fied, compiled, analyzed, & improvement actions implemented. Training in PDCA tools under way. Some type 1 poka yoke (can't accept); but not based on FMEA.	Everyone trained in PDCA tools. Tools ap- plied widely & fully. Some type 2 poka yoke (cannot pass); some based on FMEA. Defects addressed where & when they occur.	Individuals & teams know how to select & use tools. Many poka yokes of all three types (can't accept, can't pass, cant' make) based on FMEA, but not focused on priorities. Re- work prohibited.	Related tools used sys- tematically. poka yoke based on FMEA, many type 3 poka yoke (can't make). All activities based on principle of zero defects.
Control	Random inspection-based controls in place. Process control data not moni- tored effectively or used as basis for improvement activity.	pection-based Limited statistical Process In-line inspe- place. Process Control (SPC) or in-line performed on a not moni- ively or used ited poka yoke in place. Im-line inspe- performed on s. Some pol- place but not		Automated test equipment. "Cannot accept" poka yoke.	Automated inspection on majority of machines. "Cannot pass" poka yoke. SPC & process controls give associates real time feedback. "Cannot make" poka yoke.
Reduction of Variation and Six Sigma	Very high defect rate. No traceability of product through multiple streams of variation. No statistical controls or problem solv- ing.	Multiple streams of varia- tion w/ some limited traceability & standard- ized methods. Six sigma black belt trained. Starting to use statistical tools.	Reduced number of streams, product traceable but hard to manage. Some statistics used for control & problem solving.	Work standardized w/ a few streams of variation. Statistics being used to control & solve problems on regular basis, but not focused on priorities.	Standardized work ad- hered to. Problem solving & process controls insti- tutionalized. Products go through one-path of variation. Poka yoke on all high-risk failure modes.
Standardiza- tion & Kaizen	No standards visible at job. Uncoordinated local efforts to address quality problems. High scrap and reject rate.	Some standards, but often hard to follow. Some co- ordination of com- panywide efforts, still re- active.	Standards for most prob- lems, a few out of date or inaccurate. Plant quality data tracked & measured.	Standards for major prob- lems in place & being ad- hered to. Info available to associates. More than 50% of workforce involved in some form of kaizen activ- ity.	Standards for key quality problems easy to find & follow. Clear & accurate information about specs & reaction required. Full time staff train, imple- ment, monitor, control. Companywide kaizen process ensures im- provements incorporated into standards.
Value Added Work	Significant non-value added work; walking, waiting, getting parts. Task varies from cycle to cycle. Value added <35%.	Cycle fairly repetitive. Poor parts presentation & workplace layout. Value added 35%- 50%.	Parts and/or information presented to associates. Some wait time & wasted motions. Value added 50%-65%.	Associates focused on value added activity. Good parts presentation & work- place layout. Value added 65% - 75%.	Associates in constant motion performing non- strenuous value-added work. Good workplace layout. Little wasted movement. Value added > 75%.
Scrap Reduction	Process variability un- known. Scrap not meas- ured. Raw materials not inspected. Problem solv- ing does not exist. Scrap cost improvement >40%	Processes variable. Many paths w/no control. Scrap measured & raw material inspected occasionally. Problem solving sporadic. Scrap improvement 30% to 40%	Most processes in control. Many paths w/trace- ability, limited control. Measuring scrap in most areas. Sampling plans for raw materials. Organized problem solving. Scrap improvement 20% to 30%	All processes in control. A few controlled, identifiable paths. Scrap collection routine. Very little incom- ing inspection. Team- based improvement proc- ess. Scrap improvement 10% to 20%	No uncontrolled variabil- ity. One stream per prod- uct. Scrap reporting and reduction institutional- ized. All suppliers certi- fied or controlled. Priori- tized improvement proc- ess using statistical tools. Scrap improvement 0% / 10%
Gage Control	No gage control. Gages in use w/ no formal documentation.	No formal Gage System in effect, but some cali- bration performed.	Gage Calibration estab- lished using NT traceable standards. All Gages identified, labeled, & documented.	Performs formal Gage Control & some Gage R&R (Repeatability & Re- producibility) studies.	Performs MSA (meas- urement systems analy- sis). 100% Gage R&R & documentation & calibra- tion of all gages per NT standards.

	mass	Market	ting & Sales S	Systems	lean
	scan	plan	do	check	act
Voice of The Customer	No one listens to cus- tomer. No one knows what quality functional deploy- ment (QFD) or why they may need it.	QFD not practiced. Cus- tomer sees product only after it's launched. No one knows what cus- tomer says let alone what she wants.	Marketing personnel have been trained in QFD, but voice of customer still not clear. Customer of- fered chance to comment on a prototype. Quality teams trained in QFD, but while customers' spoken needs sometimes met, un- spoken needs not known	QFD & value engineering routinely applied & cus- tomers involved in critiqu- ing prototypes. QFD cap- tures voice of customer in a project for both market- ing & engineering. Spoken needs met in all cases. Unspoken needs met in many cases.	Customers formally part of new product team from concept to design & execution. You know what customer dreaming about.
Market Segmentation	No good picture of value stream. Surveys infre- quent. Markets not seg- mented.	Total value stream mapped. Regular surveys begin. Market segments sorted out w/ a prod- uct/market matrix indi- cating customer and product types and seg- ment profitability. Com- pany's strategic position- ing reevaluated.	In next iteration of com- pany strategy, major products are repositioned to meet needs of custom- ers in specific markets and improve profitability.	Value streams well under- stood. Markets segments yield benefits to customers in the form of better prod- ucts, and strategic benefits to the company in deploy- ing its core capabilities.	Competitors, suppliers, & market trends well un- derstood. Markets prop- erly segmented & sur- veyed once a month.
Marketing & Sales Meth- ods	Customers don't get right information. Prices based on cost-plus. Marketing and sales make promises that cannot be delivered because they don't under- stand company's proc- esses.	Product-out orientation. Order-to-delivery process has been mapped & ob- vious problems fixed. But marketing and sales still cannot balance cus- tomer needs with the company's capabilities.	Marketing & sales staff trained to understand strengths and weaknesses of companies core value- adding processes.	Market-in orientation. In- ternal as well as external customers get information they need. Prices competi- tive. Order-to-delivery process has been stream- lined.	Service orientation. Cus- tomers are perceptive. Product pricing based on perceived value. Order- to-delivery process runs like clockwork.
Customer Relationships	Firm has no system for managing customer rela- tions & has a product-out market orientation.	Orientation still product- out but has begun man- aging systems for qual- ity, cost & delivery.	Customer relations have been established. Market- in orientation reflected in company's vision & mission.	Customer requirements cascaded to all associates through policy deployment and visual management. Customer feedback to manufacturing & design is immediate.	Customer relations strong. There is a refined system of interaction & feedback. Customer needs anticipated. After sales service delights cus- tomer.
Perfect Service	Firm has no system for managing customer satisfaction. Customers don't know whom to turn to for service. Associates not well informed. Cus- tomer retention rates low.	Your service process mapped. Obvious prob- lems fixed.	Marketing & sales staff trained in how to deliver perfect service. Key per- sonnel are trained in prob- lem solving, but problems are not always resolved at the root cause level. Therefore, the same con- cerns are sometimes re- peated	Front-line associates em- powered to please cus- tomer & have information they need to act. All asso- ciates trained in root cause analysis thus corrective ac- tions get to root cause. No repeat concerns.	Entire organization organized to respond to customer requests. You regularly surprise your customers w/ great serv- ice. Customer require- ments all addressed in system, process, & prod- uct design.
Knowledge of The Customer	Customer experience not tracked. Cross-functional communication conten- tious.	Only serious customer complaints tracked.	Systematic customer tracking begins, but cross- functional communication still a problem.	A cross-functional data- base developed to support front-line associates in serving customer. All cus- tomer concerns tracked, communicated, & correc- tive actions taken.	Cross-functional database tracks customer experi- ence. associates can take appropriate & timely ac- tion to serve customers.
Brand Equity	The brand has no clear po- sition. Don't know what customer says let alone what she wants in most market segments.	A brand charter created, but while customers' spoken needs sometimes met, unspoken needs not known.	Brand charter now effec- tively communicated to customer in all important market segments. Cus- tomer has clear idea of products / services and af- ter sales support offered by the company.	Brand well positioned. Spoken product / service and after sales support needs met in all segments. Unspoken needs met in major market segments.	You know what cus- tomer dreaming about. Your brand excels at giv- ing customers what they really want. Loyalty soars.

	mass	Eng	gineering Syst	ems	lean
	scan	plan	do	check	act
Design Process	No gated product devel- opment system. Sequen- tial engineering. Time to market much longer than average. Fragmented, se- quential design cycle, no connection to manufactur- ing. No coordination of product lines.	Gated system planned. Sequential engineering. Incomplete information about customer. Design tossed "over wall" to manufacturing. Time to market much longer than average. Gates still lack discipline	Gated system established. Product development team leaders teams have been trained in program management. Concurrent engineering & manufac- turing feedback used, but design review still weak.	Strong design review. Cross-functional & inter- organizational teams rou- tinely used. Time to mar- ket on par w/ industry. Strong design review.	Company first to market w/ innovative products. Product managers heavy- weights who report di- rectly to CEO
Design Platforms	Distinct product platforms & part variety proliferate. New product launches late, over budget, & don't meet customer expecta- tions.	Company undertakes a se- rious parts-reduction pro- gram attacking obvious waste in product & parts variety.	Company develops a seri- ous platform-based cost- reduction strategy	Product platforms, mod- ules, & systems facilitate fast, flawless execution of engineering, order entry, documentation, procure- ment & creation of work instructions.	New designs require no new drawings. Running changes handled in fac- tory. Supply chain fully integrated into zero engi- neering.
Design for X	Engineering knows best. No one listens to voice of customer.	Engineering can't hear voices of customer. Bu- reaucratic design control. No QFD or target costing.	Cross-functional team ini- tiates TQCD design im- provements using quality tools: QFD, target cost, FMEA, DFMA, DOE, Taguchi DOE, & VE.	Concurrent engineering applied to all new products & extended to rapid proto- types & reliability engi- neering.	Target costs routinely met on all major new product introductions. CAD/CAM & computer simulations introduced after process wastes eliminated.
Technical Ri- sk Manage- ment	Risk analyzed by experts in undisciplined fashion after fact.	Risk management treated as a business process, but applied only to technical issues upon request.	Engineering staff trained in FMEA, its application still mainly pro forma.	FMEA scorecards always prepared for technical issues & sometimes to track schedule & cost.	FMEA scorecards proac- tively used to assess & clarify technical, cost, & schedule risk.
Preproduction Pioneering (3P)	Engineering throws prod- uct over wall to manufacturing, after ig- noring what marketing had to say about customer requirements.	Cross-functional teams of engineering, marketing, production, & suppliers begin to cooperate in launching new products.	Marketing, engineering, & manufacturing trained in 3P.	Cross-functional "how's it built" review teams con- struct 2-D & 3-D models of process & brainstorm 7 alternatives for critical process steps.	Products designed to tar- get cost, designed for lean production w/ guar- anteed process capability. Quality built in into sys- tem w/ extensive poka yoke.
Process Capability	No process validations or validation on start-up only. Sporadic attempts improve process capabil- ity driven by crisis & ma- jor cost or quality prob- lems. Little process capa- bility data.	Industry & benchmarks assessed & planning be- gins. Validations w/ occa- sional supplier input. Management has little training on process capa- bility & control tech- niques & training cas- caded to workforce.	Validations routinely w/ supplier input. Manage- ment & leadership have been educated on process capability & control tech- niques & training cas- caded to workforce.	Leadership & workforce aware of all incapable processes & can readily produce machine capabil- ity study data & corrective action plans.	Computer-modeled vali- dations. Processes de- signed w/ data from com- puter validation history. Process & pre-control techniques in use. On- floor verification. Process in place to capture and act upon lessons learned
Launch Management	No understanding about launch risks. Organiza- tional misconnects and disconnects are common.	Poor understanding about launch risks, including supplier deliveries, pro- duction, & shipment, service, & installation re- quirements.	Cross-functional launch team formed, but ramp-up still slow. Suppliers disorganized, & documentation is poor & training for sales & serv-	Launch improves, but documentation & training lag product availability. Product ready for market, sales & service ready for product.	Market ready for prod- uct, product ready for market, sales & service ready for product.
Environmental Impact	Low awareness of impact of products & processes. Regulatory noncompli- ance and fines commons.	Industry & benchmarks assessed & planning be- gins for implementing cel- lular manufacturing. Oc- casional infringement of regulations.	loc tiation of programs to improve thru appropriate technology & equipment improvement activities.	Companywide programs for improving environ- mental conditions, compli- ance w/ regulations im- proved. Design process in- cludes criteria for environmental impact	Full compliance w/ regu- lations in each market. Provides leadership in environmental affairs, useful to government as information source
Supplier Effectiveness	Unable to reduce costs. No plan. Profits eroding. Designs transmitted to suppliers from company; supplier feedback limited to cost	Industry & benchmarks assessed & planning be- gins for implementing cel- lular manufacturing	Supplier TQCD feedback solicited on new designs before finalization. Long- term contracts offered to best suppliers.	Formal lean programs w/ customers & suppliers, sharing of savings & knowledge. Involvement in design & analysis pro- jects begins.	Supply partners & cus- tomers actively involved in product development from earliest stages. 85% of all suppliers have long- term contracts.

	1	2	3	4	5
	mass	Manufactu	ring Operation	ns Systems	lean
	scan	plan	do	check	act
Balanced Operations	Operations not linked to previous or next opera- tions. WIP between all sta- tions.	Operations produce to predetermined schedule. Not linked to or opera- tions. Inventory waits in queue for next processes.	Operations produce at varying rates, but linked to subsequent operations.	Processes produce at a planned cycle time based takt time. Constraints man- aged w/ safety stock. Transfer in small batches w/ minimal WIP. Produc- tion stops at predetermined WIP level.	All steps in process pro- duce at takt time. Items move through process one at a time. Virtually no WIP.
Flow Production	Machines located in sepa- rate departments and build- ings. Cannot see parts flow. Parts routings fixed. Flow arranged by types of processes, not by products or customers. Little FIFO & too much transport & overproduction.	Value stream mapping done & plan is made to realign processes into product families.	Production organized by product families. Product flow clear. Constraint processes identified. Lot sizes fixed.	Product flow close to 1:1 w/ standard packs at many processes. Processes grouped by product flow. Processes outside of flow linked w/ pull systems.	Processes set up to com- bine jobs to maintain productivity. Most proc- esses that can be inte- grated into product- focused modules have a continuous one-piece flow.
Cellular Manufacturing	Single skilled associates run only one machine. Work not balanced. Inven- tory builds up between processes.	Process focused equip- ment layout. Material flow fragmented w/ a lot of WIP. Industry & benchmarks assessed & planning begins for im- plementing cellular manufacturing.	No min/max WIP levels; more WIP than needed. A product-focused JIT cell formed. Associates run several machines, but workflow & WIP isn't standardized. Quality, ma- terial flow, & responsive- ness need improvement.	Product-focused cells. Min/max WIP levels es- tablished & controlled. operation visibly focused on customer. Multiskilled associates run several ma- chines. WIP inventory standardized. Mistake proofing reduces defects.	Cell layout w/ one-piece flow. Lowest cost/unit. Cannot add WIP. associ- ates only load equipment. Cells balanced & mate- rial movement ergo- nomic. Production boards display status of produc- tion vs. requirements.
Linear Staffing and Associate Utilization	Staffing level constant w/out regard to volume. No flexibility in staffing levels. One associate per machine. Associate waits on machine/process to fin- ish cycle. associate utiliza- tion <50%.	Adjustment of staffing only accomplished for significant volume changes. Associate runs several machines of same process. Monitors opera- tion. Utilization 50%- 60%.	Limited, periodic staffing adjustments made based on projected output. asso- ciate runs several similar machines w/ some self- stopping features & poka yoke. Utilization 60%- 70%.	Staffing levels adjusted daily based on production schedules associate loads/unloads several ma- chines. Self-stopping fea- tures w/andon alert sys- tem. Utilization 70%-85%.	Staffing adjusted based on volume. Labor per unit constant or improv- ing. Constant adjustments made during day. Asso- ciates only load w/auto eject. Run several ma- chines w/andon alert sys- tem & self-stop. Utiliza- tion >85%
Jidoka	All processes require man- ual assistance. Oversized equipment designed for large lots & speed. No poka yoke. Defects passed to customers	Industry & benchmarks assessed & planning be- gins for implementing ji- doka to separate human work from machine work.	Systematic training in ji- doka & mistake proofing begins. Some machines equipped w/ automatic shut-off, but associates always present while ma- chines work.	Human & machine work separate. Warning lights indicate when a problem occurs. process stops when an abnormality oc- curs.	Complete traceability of all parts & all attributes. Defect & error informa- tion helps teams create more poka yoke devices.
Constraint Management	All operations standalone. Workstations isolated & separated by obstacles and inventories. Measures sub- optimal based on standards & efficiencies. Associates not grouped together. Ma- chines different from each or & often there is just a single machine of each type.	Focusing on a few vs. all equipment based on cur- sory bottleneck analysis. Assembly lines dedi- cated to a single family of products. Assembly lines have fixed cycle times. Analysis of equipment. Work has been started on simplify- ing & standardizing equipment.	Bottlenecks identified & managed, but lack overall constraint focus. Limited inventory at non- bottleneck locations. Af- termarket requirements inform equipment & tool- ing. Workstation design not an obstacle in group- ing associates. Some lines can work at different rates. Equipment simpli- fied; a standard defined by process type.	No non-bottleneck inven- tories. Non-bottleneck op- erations run less than bot- tleneck & resources ad- justed to bottleneck as re- quired. Most lines can adapt to several different takt times. All new equip- ment complies w/ stan- dard & in line w/ re- quirements of developed production system.	Bottlenecks identified. Overall performance linked and resources pri- oritized to bottleneck. All lines multi-process, multi-product and capable of producing at different takt times w/ no loss of productivity. No additional investment needed for aftermarket. Process Engineering & Production act together to simplify equipment.
Quick Changeover	No program to reduce setup times. Lot sizes = 1 or more weeks. Infrequent changeover requires 4 hours to 2 days. Tools & tooling disorganized, stored off-line or off-site.	Industry & benchmarks assessed & planning be- gins to reduce changeo- vers on constraint equipment & processes.	Training in changeover begins. Changeover teams separate internal & exter- nal changeover on con- straint equipment. Setups reduced 50—80%. Lot sizes still too large.	Teams convert internal to external setup. Setup times now measures in minutes. Lot sizes standardized & support pull production. All associates trained.	One-touch changeovers done in 3 minutes on con- straints. Tools color coded. Everyone follows a standard procedure. Lot sizes only a few hours.

Maintenance Management	No priorities assigned. No work requests or jobs planned. Schedules not issued. Utilization < 50%. VA time 10% to 15%. La- bor reduction opportunity >40%.	Work orders written & top 10 priorities estab- lished. Approximately 25% planned w/ sched- ules being issued. No backlog. Utilization 50% to 60%. VA time 15% to 25%. Labor reduction 30%.	Work order flow estab- lished. Priorities definition established. 30% to 40% planned & scheduled. Compliance to schedule 50%. Building backlog. Utilization 60% to 75%. VA time 25-35%. Oppor- tunity 20%	Work orders well con- trolled. Priorities estab- lished. 50% planned. Compliance to schedule of 60% to 70%. One-week workable backlog. Utiliza- tion 75% to 85 %. Labor opportunity 10%.	Clearly defined work or- der flow & feedback. Pri- orities ensure work per- formed. 60% to 70% planned & scheduled. Compliance 80% to 90%. Manage workable proac- tive project list to 2-3 weeks. Utilization >85%. VA 50% & no labor re- duction.			
Focused Equipment Improvement	Many breakdowns; OEE not measured. Company uses maintenance special- ists. Result: many break- downs & " fire-fighting" maintenance. Machine downtime not tracked OEE = 35—50%.	OEE baselined by a team of specialists. Plan- ning begins to implement total productive mainte- nance (TPM) to raise OEE on constraint equipment to 85% or bet- ter. Downtime tracked but only as part of con- trolling direct labor hours earned	Systematic training in TPM begins. Company pi- lots preventive mainte- nance system. Downtime tracked & Pareto analysis done. Major reasons ad- dressed. OEE = 50% 60%.	OEE = 60—85%. Com- pany has preventive main- tenance system installed & pilots predictive maint. All downtime tracked & ad- dressed. Overall Equip- ment Effectiveness calcu- lated & from 65% to84%	OEE > 85%. Company modifies machines to al- low for computer diagno- sis & prediction of prob- lems. OEE >85%			
Preventative Maintenance	No preventive maintenance (PM) program. All mainte- nance strictly reactive. Company has many break- downs & lives in "fire- fighting" mode.	Company pilots preven- tive maintenance system, but lacks measures & tracking of results. Many missed tasks due to scheduling problems. No associate involvement.	Company has preventive maintenance system in- stalled & pilots predictive maintenance. Autono- mous maintenance im- proves maintenance re- sponse	PM program that measures performance & tracks re- sults. Company wide us- age of predictive mainte- nance tools.	Well structure, visible, organized PM system based on lean principles. Associates involved & based on FMEA. Com- pany has modified ma- chines to allow for com- puter diagnosis & predic- tion of problems.			
Capacity & Throughput	Poor machine utilization. Unpredicted downtime. No predefined set-up times. Demand not achieved. Up- time <50%	Minimal scheduled set- up times. Planning oc- curs for machine usage. Frequent downtime. Up- time 50% to 60%	Non-value activities exist in set-up & downtime. Machine occasionally down. 70% to 80% uptime	Minimal non-value activi- ties exist in setup & scheduled downtime. Rare downtime on machines. Schedule always met. 80% to 90% uptime	Minimal setup time & downtime. >95% uptime, >95% throughput. De- mand always achieved w/in scheduled time.			
Autonomous Maintenance	Company uses mainte- nance specialists. Associ- ates "break it," and main- tenance "fixes it."	Company completes steps 1-3 of autonomous maintenance on model equipment.	Steps 1-3 of autonomous maintenance completed on constraints. Company completes 4-6 of autono- mous maintenance on model equipment.	Company completes steps 4-6 of AM on all equip- ment. Company completes all steps of autonomous maintenance on all critical equipment.	Autonomous mainte- nance concepts incorpo- rated as standard for new purchased machinery.			
Equipment Design	Finance department makes equipment decisions based on least cost. Manufactur- ing & maintenance have zero input.	Life cycle cost consid- ered as an investment cri- teria. Equipment im- provement teams gather data on problems w/ new equipment.	Finance, engineering, & maintenance personnel trained in life cycle costing, which applied to new projects.	Life cycle cost & QA ma- jor equipment investment criteria. Startup problems routinely documented & fed into design process.	TPM & MP (maintenance prevention) criteria guide design. Early equipment management data systems streamlined.			
Early Equipment Management	Worn out tools, machines, no standardizing, new ma- chines selected for avail- ability	Book shelving equipment improvements, machines selected because of least cost	Process developed for standardization of equip- ment, new machines cho- sen for least cost/ piece	Limited standard tooling used, new machines se- lected for lowest life cycle cost	Standardized tooling, re- duced life cycle costs, machines chosen based on reliability performance			

				1			2			3				4				5
